

Faster builds with Apache Buildr

Tammo van Lessen

About me: Tammo van Lessen

The talk today

What?

Why?

Motivation & History of Buildr

How?

The Architecture

The Principles

The Basics

Now What?

Apache Buildr

- ▶ Ruby-based Build Tool for Java
 - ▶ ~~„The build tool that does not suck“~~
 - ▶ „Build like you code“
- ▶ First Ruby Project @ ASF
- ▶ Incubated: 2007-11-01
- ▶ Top Level Project since 2008-12
- ▶ Most Recent Version: Buildr 1.4.8 (2012-11-06)

Apache ODE

BPEL-based workflow engine,
enterprise,
complex build

35+ modules
9 databases
120+ dependencies
3 distributions
heavy tooling

Maven2

6739 lines of XML
in 53 files.

L₁ O₁ V₄ E₁

H₄ A₁ T₁ E₁

What's good with Maven?

- ▶ Maven Central!
- ▶ Provides standard means to build arbitrary projects
- ▶ Broad acceptance
- ▶ ...

What's wrong with Maven?

- ▶ Transitive Dependency Resolution?
- ▶ Reproducible?
- ▶ „Maven Uncertainty Principle“
 - ▶ With POMs
 - ▶ With Artifacts
 - ▶ With Plugins
- ▶ No Scriptability
 - ▶ 34 lines of XML to merge two SQL files?
- ▶ Heavy!
- ▶ Extensibility is a mess!
- ▶ ...

Our requirements

- ▶ **Best of Maven**
- ▶ **Native support for scripting**
- ▶ **No XML**
- ▶ **Flexible**
- ▶ **Extensible**
- ▶ **Smart**

Buildr

912 lines in 3 files

Buildr

And twice as fast!

Architecture

Buildr → **Rake** → **Ruby**

projects, lifecycle,
artifacts, plugins

tasks, files,
dependencies

arbitrary
scripting

Why Ruby?

- ▶ **Awesome scripting language**
- ▶ **Easy file manipulation**
- ▶ **Native support for regular expressions**
- ▶ **Lightweight syntax**
- ▶ **Easy collection processing**
- ▶ **DSL friendly**
- ▶ **JVM friendly**
- ▶ **...**

Why Rake?

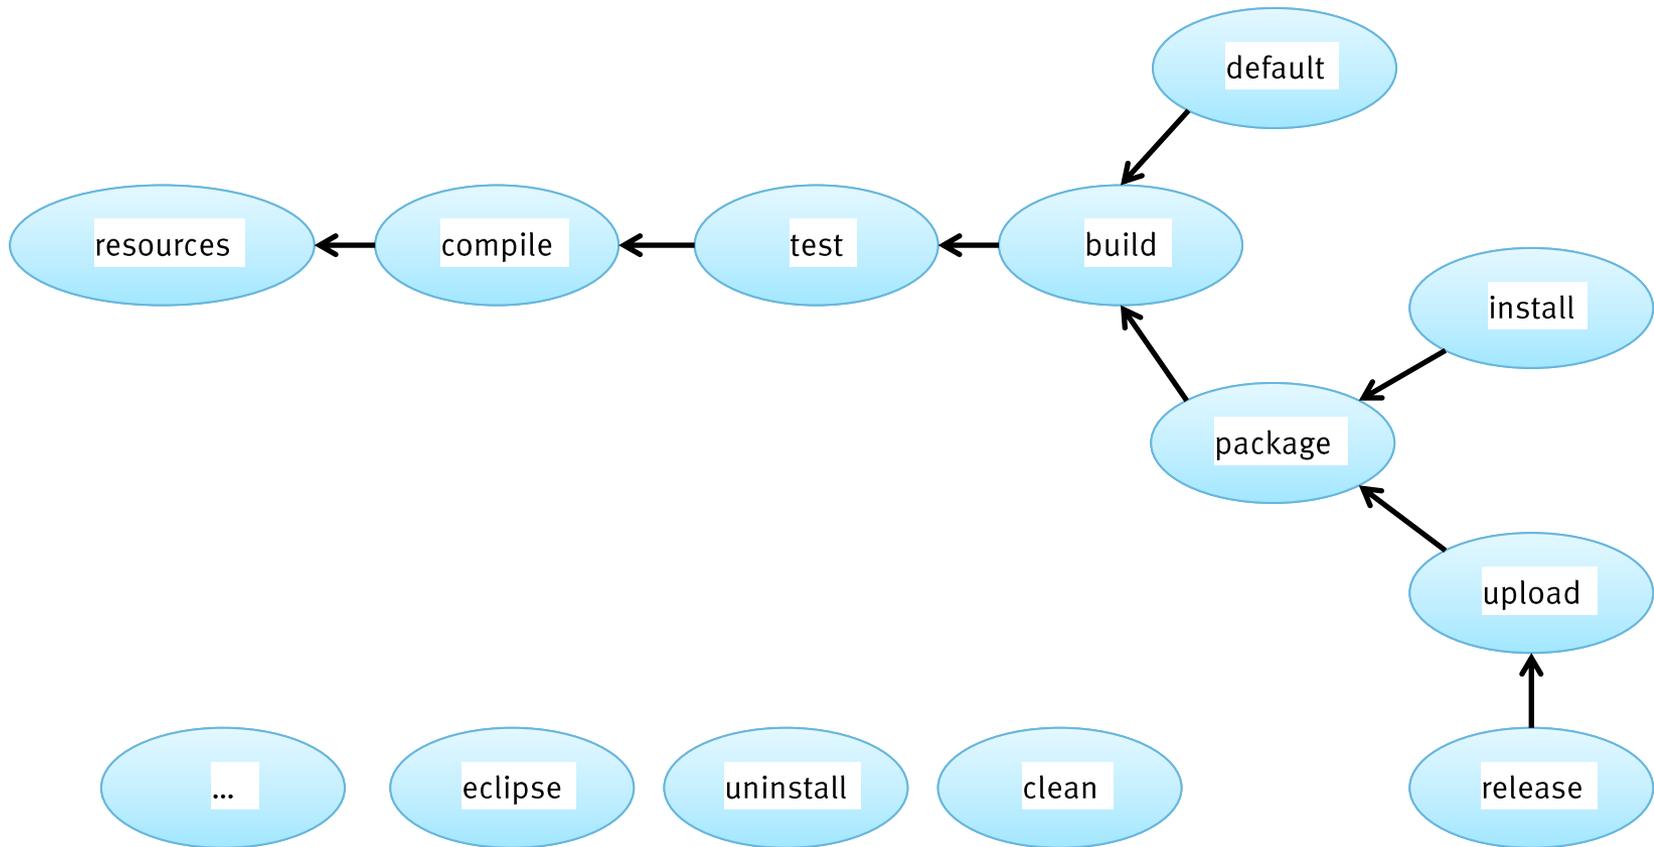

- ▶ „The Ruby Make“
- ▶ Inherently dependency driven
- ▶ Introduces various task types

Demo time!

File Task

```
class FileTask < Task
  # Is this file task needed? Yes if it doesn't exist, or if its time stamp
  # is out of date.
  def needed?
    return true unless File.exist?(name)
    return true if out_of_date?(timestamp)
    false
  end
  # Time stamp for file task.
  def timestamp
    if File.exist?(name)
      File.mtime(name.to_s)
    else
      Rake::EARLY
    end
  end
  private
  # Are there any prerequisites with a later time than the given time stamp?
  def out_of_date?(stamp)
    @prerequisites.any? { |n| application[n].timestamp > stamp}
  end
end
```

It's all about dependencies

Artifact Dependencies

- ▶ Native support for Maven repositories
- ▶ Support for local jars
- ▶ Transitive dependency resolution via Ivy and Aether (plugins)
 - ▶ New and cool: lock_jar

Specifying Artifacts

```
AXIS_VERSION = '1.2'  
compile.with "org.apache.axis2:axis2:jar:${AXIS_VERSION}"
```

```
AXIS2 = 'org.apache.axis2:axis2:jar:1.2'  
compile.with AXIS2
```

```
AXIOM = group('axiom-api', 'axiom-impl', 'axiom-dom',  
:under=>'org.apache.ws.commons.axiom', :version=>'1.2.4')
```

```
OPENJPA = ['org.apache.openjpa:openjpa:jar:1.2.1',  
'net.sourceforge.serp:serp:jar:1.12.0']
```

```
JAVAX = struct( :activation =>'javax.activation:activation:jar:1.1',  
:persistence =>'javax.persistence:persistence-api:jar:1.0', :stream  
=>'stax:stax-api:jar:1.0.1' )  
compile.with JAVAX.activation, JAVAX.persistence
```

Building: Compiling & Testing

- ▶ **Polyglot**
 - ▶ Java, Scala, Groovy, Ruby, Clojure, roll your own
- ▶ **Hooks for code generation**
- ▶ **Resources / Filters**
- ▶ **Tests**
 - ▶ JUnit, TestNG
- ▶ **Continuous Compilation**

Packaging

- ▶ ZIP
- ▶ JAR
- ▶ WAR
- ▶ AAR
- ▶ EAR
- ▶ OSGi Bundles
- ▶ TAR & TAR.GZ
- ▶ Javadocs
- ▶ Sources

Integrating Ant

```
<taskdef name="xmlbean"  
    classname="org.apache.xmlbeans.impl.tool.XMLBean"  
    classpath="path/to/xbean.jar" />  
  
<xmlbean classgendir="${build.dir}"  
    classpath="${class.path}"  
    failonerror="true">  
    <fileset basedir="src" excludes="**/*.xsd"/>  
    <fileset basedir="schemas" includes="**/*.*/>  
</xmlbean>
```

Integrating Ant (2)

```
def xmlbeans(files) do
  Buildr.ant "xmlbeans" do |ant|
    ant.taskdef \
      :name => "xmlbeans",
      :classname => "org.apache.xmlbeans.impl.tool.XMLBean",
      :classpath => 'org.apache.xmlbeans:xmlbeans:jar:2.3.0'
    ant.xmlbeans \
      :classpath => project.compile.dependencies,
      :srcgendir => project._('target/generated')
      :failonerror => "true" do
        files.flatten.each do |file|
          ant.fileset File.directory?(file) ? { :dir => file }
            : { :file => file }
        end
      end
    end
  end
end
```

Releasing

1. Check that the version to be released and the next version are different
2. Check that the project is being tracked by Git, SVN or HG
3. Package test and deploy the artifacts using THIS VERSION value minus the -SNAPSHOT suffix (if any)
4. Tag the repository with the released version number
5. Update the value of THIS VERSION in the buildfile with the next version number

Demo Time!

Wir lösen das – persönlich!

innoQ

Some more examples

```
# Generate SQL DDL schemas for all databases
%w{ derby mysql oracle sqlserver postgres }.each do |db|
  db_xml = _("src/main/descriptors/persistence.#{db}.xml")
  partial_sql = file("target/partial.#{db}.sql"=>db_xml) do
    OpenJPA.mapping_tool \
      :properties => db_xml,
      :action => "build",
      :sql => db.to_s,
      :classpath => projects("store", "dao")
  end
  # Add Apache license header
  header = _("src/main/scripts/license-header.sql")
  sql = concat(_("target/#{db}.sql") => [header, partial_sql])
  build sql
end
```

Some more examples (2)

```
# Compile using all Eclipse BIRT libraries
BIRT_WAR = artifact("org.eclipse.birt:birt:war:1.4.1")

unzip_birt = (unzip _("target/birt") => BIRT_WAR).tap do |t|
  compile.with Dir[_("target/birt/WEB-INF/lib") + "/*.jar"]
end

compile.enhance [unzip_birt]
```

Some more examples (3)

```
Java.classpath << [ "org.antlr:antlr:jar:3.0", "antlr:antlr:jar:2.7.7",  
"org.antlr:stringtemplate:jar:3.0" ]
```

```
Java.org.antlr.Tool.new("-i #{input} -o #{output}").process
```

Example Extension

```
module GitVersion
  include Extension

  @version = `git log -1 --pretty=format:%H`

  after_define do |project|
    project.packages.each do |jar|
      f = file project._("target/git-version.txt") do |f|
        Buildr.write f.to_s, @version
      end
      jar.enhance [f]
      jar.include f, :as => "META-INF/git-version.txt"
    end
  end
end
end
end
```

Example Extension (2)

```
# apply extension to a single project
define 'my-project' do
  extend GitVersion
end
```

```
# apply extension to all projects
class Buildr::Project
  include GitVersion
end
```

And more...

Layouts Profiles Environments Code Coverage,
Notifications. Eclipse. IntelliJ. GPG.
CheckStyle, FindBugs, JDepend, Sonar, ...

Libs

Antlr, BND GWT Hibernate OpenIPA, Jetty,
XMLBeans, ProtoBuf, ...

Plugins

Android, OSGi, JavaScript JUnitTesting, AspectJ,
Flex, ...

Best practices

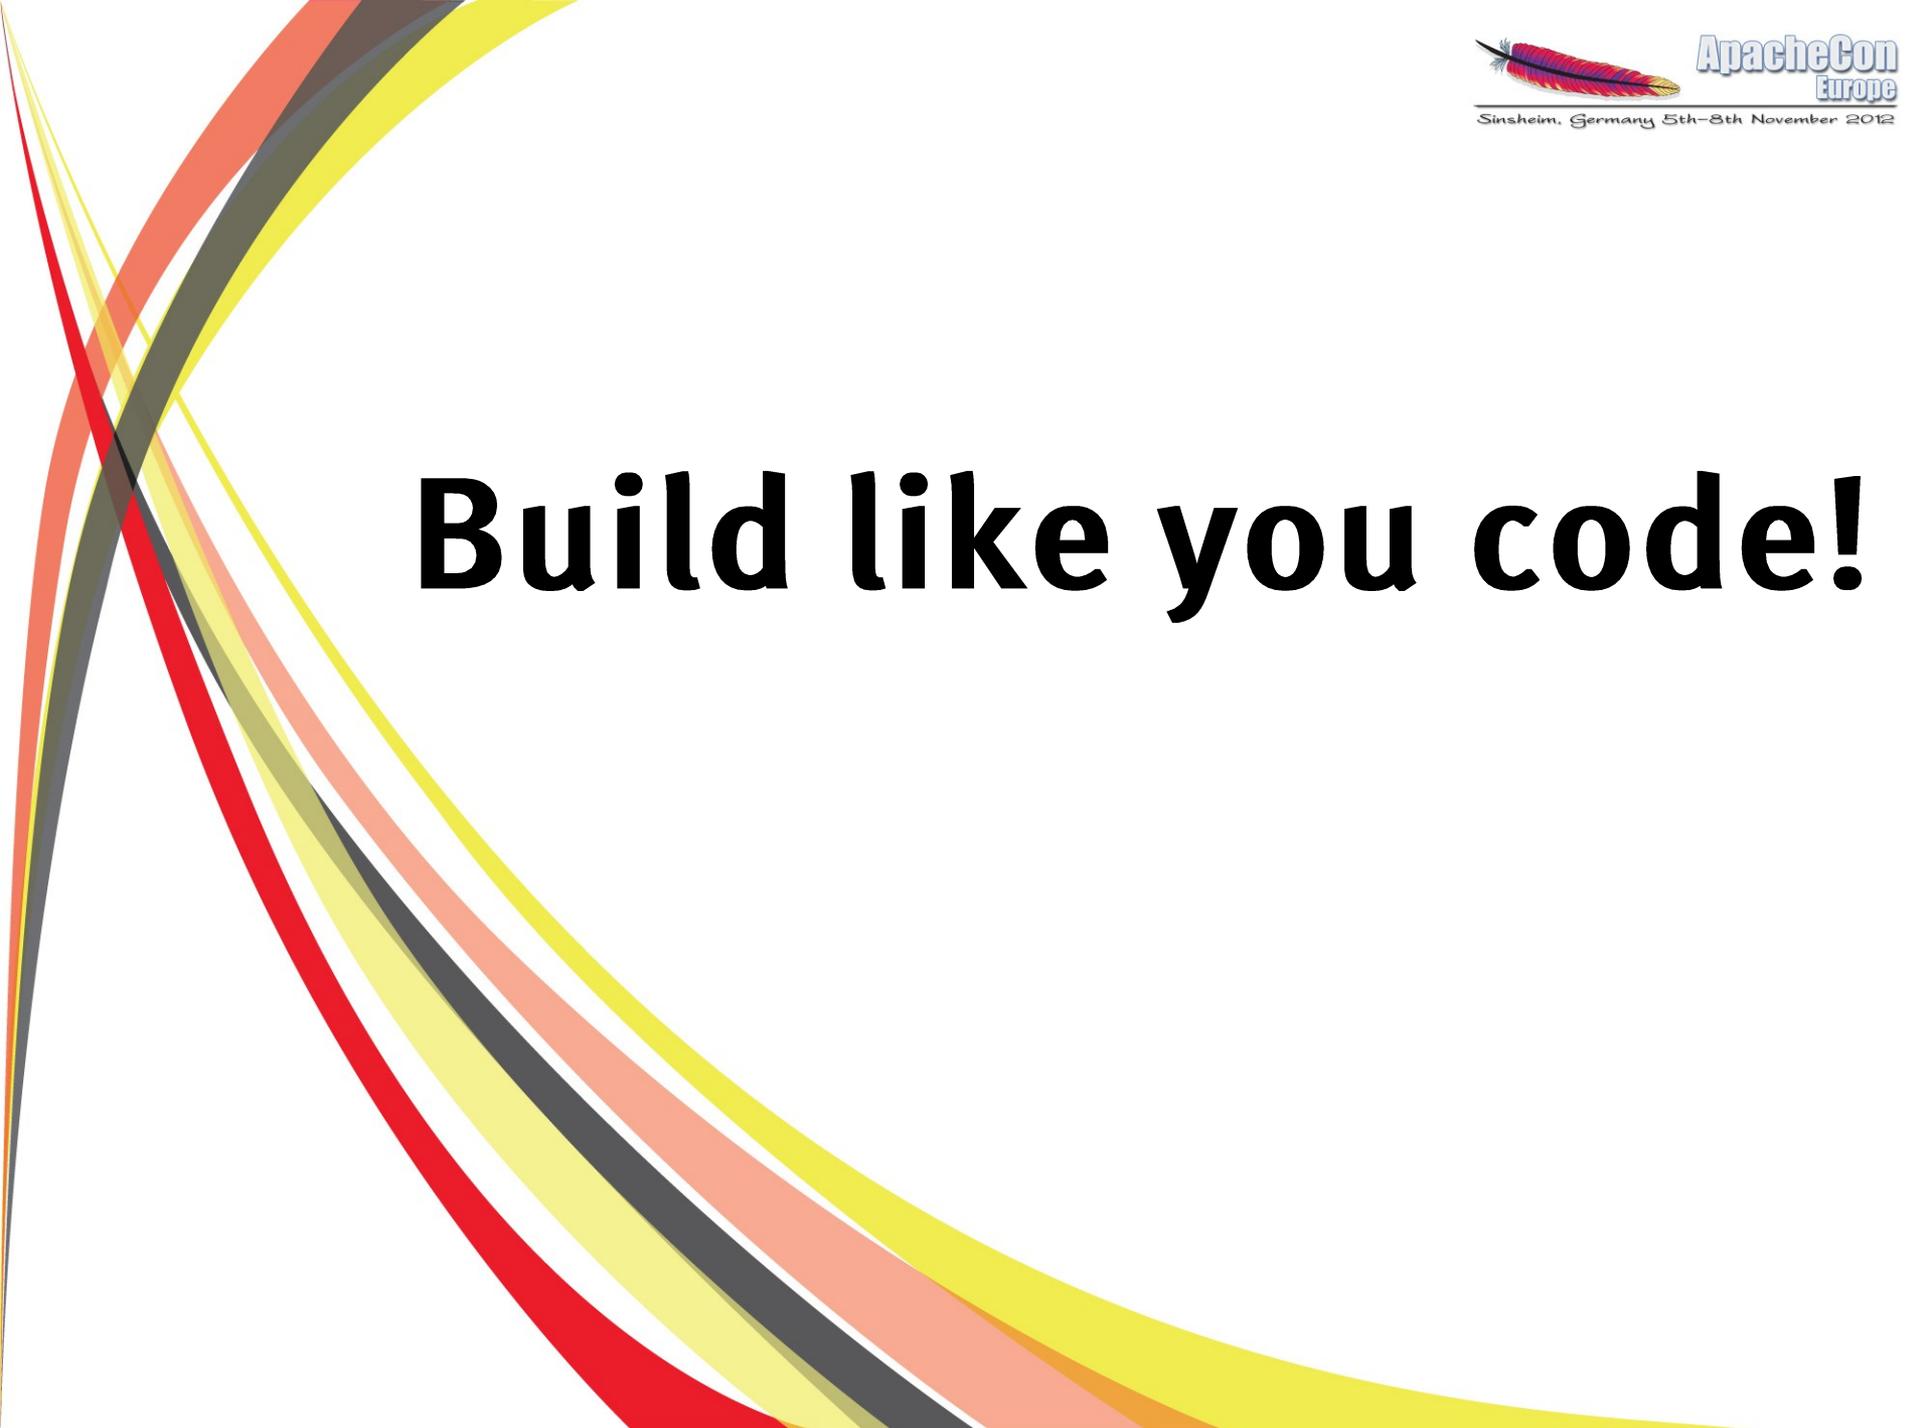

Monkey see, Monkey do!

Beware of the DSL

Ask for support! Get involved!

buildr.apache.org

Enjoy faster builds!

Build like you code!

Thank you!
